Problem – Solution Fit

The Problem-Solution Fit canvas confirms that the problem found with the customer is real, and that the proposed solution actually solves it. It helps identify behavioral patterns and recognize what would work and why.

Purpose:

- Solve the complaint-handling problem in a way that fits the real state of customers and support staff.
- Succeed faster and increase solution adoption by tapping into existing support channels and behaviors.
- Sharpen communication and onboarding with the right triggers and messaging.
- Increase touch-points with customers by solving a frequent, urgent, and costly problem, building trust along the way.

Filled Canvas — Customer Care Registry

No.	Canvas Block	Filled Content
1	Customer Segment(s) (CS)	• End customers of a business who need to raise or track a complaint / service request (Standard, Enterprise, and VIP account holders). • Support agents, support managers, and admins within the business who must resolve those complaints.
2	Problem / Pains (PR)	• Customers cannot raise a complaint and track its progress in one place; they get no visibility into who is handling it or when it will be resolved. • Agents and managers have no unified, categorized view of complaints or customer history, causing slow, inconsistent resolutions.
3	Triggers (TR)	• A billing error, delivery delay, product defect, security concern, or poor experience prompts the customer to contact support. • A growing backlog of unresolved queries and repeated escalations prompts managers to look for a better system than email threads or spreadsheets.
4	Emotions: Before / After (EM)	• Before: frustrated, ignored, anxious about whether the issue is even being worked on. • After (with a good solution): reassured, in control, confident the issue is tracked and will be resolved on time.
5	Available Solutions (AS)	• Generic helpdesk SaaS tools (e.g. Zendesk, Freshdesk), plain email/phone support, manual spreadsheets to track tickets, ad-hoc WhatsApp groups among support staff.
6	Customer Constraints (CC)	• Limited budget for large enterprise helpdesk licensing, need to support multiple intake channels (phone, email, chat, WhatsApp, in-person visit), and data-privacy/security expectations for personal and complaint data.
7	Behaviour (BE)	• Customers call or email support, wait on hold, repeat their issue to whichever agent picks up, and follow up manually (calling again or emailing) just to check status.
8	Channels of Behaviour (CH)	• 8.1 Online: email support, live chat, WhatsApp, web contact forms. • 8.2 Offline: phone calls, in-person branch/service-center visits.
9	Problem Root Cause (PRC)	• Complaint data and communication history are scattered across disconnected channels with no central ticketing system, no

		automated categorization or prioritization, and no shared visibility between customer and agent.
10	Your Solution (SL)	Customer Care Registry: a unified web platform where customers raise and track tickets in one place; agents and managers manage the full ticket lifecycle with AI-assisted categorization (Google Gemini API), multi-channel interaction logging, feedback capture, and analytics dashboards — closing the visibility gap between customer and support team, with a knowledge base for self-service.
