Project Overview

Project Name: Customer Care Registry

Project Description: A MERN-stack (React + Express + TypeScript) customer complaint and support management platform covering customer management, AI-assisted ticket categorization (Google Gemini API), multi-channel interaction logging, feedback collection, a knowledge base, analytics dashboards, audit logging, and configurable SLA settings, with role-based access for Customers, Support Agents, Support Managers, and Super Admins.

Project Version: [Version Number]

Testing Period: [Start Date] to [End Date]

Testing Scope

- User registration, login, and role-based access control (Super Admin, Support Manager, Support Agent, Customer).
- Customer management: adding, editing, and viewing customer records and history.
- Complaint / ticket management: raising complaints, assignment, status updates, timeline, and SLA due dates.
- AI-assisted complaint categorization (category, priority, department) via the Gemini API, including the keyword-based fallback.
- Interaction logging across channels (call, email, chat, visit, WhatsApp, video call).
- Feedback collection, rating, and sentiment derivation.
- Knowledge Base article publishing and search.
- Analytics dashboard metrics and charts.
- Audit logging and system settings (SLA hours, auto-escalation).

User stories / requirements covered: USN-1 through USN-19 as defined in the Product Backlog (registration, login, customer management, ticket management, AI categorization, interaction logging, feedback, knowledge base, analytics, audit, and settings).

Testing Environment

URL/Location: [Web URL or Application Location, e.g. http://localhost:5173 for local testing]

Credentials (if required): [Username/Password for each test role — Customer, Support Agent, Support Manager, Super Admin]

Test Cases

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-001	Customer registers with valid name, email, phone, address, and password.	1. Open the registration page. 2. Enter valid full name, email, phone, address, and password. 3. Click Register.	Account is created; success message shown; user is redirected to login.	As expected.	Pass
TC-002	Customer attempts to register with an email that already exists.	1. Open the registration page. 2. Enter an email already registered in the system. 3. Click Register.	Registration is rejected with a clear 'email already in use' error.	As expected.	Pass
TC-003	User logs in with valid email and password.	1. Open the login page. 2. Enter valid email and password. 3. Click Login.	User is authenticated (JWT issued) and redirected to their role-specific dashboard.	As expected.	Pass
TC-004	User attempts to log in with an incorrect password.	1. Open the login page. 2. Enter a valid email with an incorrect password. 3. Click Login.	Login is rejected with an 'invalid credentials' error; no token is issued.	As expected.	Pass
TC-005	Customer raises a complaint with all required fields and an attachment.	1. Log in as a customer. 2. Go to Ticket Center and click 'Raise Complaint'. 3. Enter title, description, category, and attach a file. 4. Submit.	A new ticket is created with a unique ticket ID and status 'New'; it appears in the customer's ticket list.	As expected.	Pass
TC-006	Customer attempts to submit a complaint without a title or description.	1. Log in as a customer. 2. Open 'Raise Complaint'. 3. Leave title and description blank. 4. Submit.	Form validation blocks submission and highlights the required fields.	As expected.	Pass
TC-007	New complaint is auto-categorized by the AI module.	1. Raise a complaint describing a billing error. 2. Submit the complaint. 3. Open the ticket as an agent.	Category, priority, and department are auto-suggested (e.g. 'Billing', 'High', 'Finance') based on the complaint text.	As expected.	Pass
TC-008	AI categorization falls back to keyword heuristics when the Gemini API is unavailable.	1. Disable/simulate an unavailable Gemini API key. 2. Raise a new complaint. 3. Open the ticket as an agent.	A category, priority, and department are still assigned using the keyword-based fallback; no error is shown to the customer.	As expected.	Pass
TC-009	Support manager assigns a ticket to a support agent.	1. Log in as a support manager. 2. Open an unassigned ticket. 3. Select an agent and click Assign.	The ticket's assigned agent updates; the ticket appears in that agent's queue.	As expected.	Pass
TC-010	Support agent updates a ticket's status and adds a timeline note.	1. Log in as a support agent. 2. Open an assigned ticket. 3. Change status to 'In Progress' and add a note. 4. Save.	Status updates immediately; a new timestamped entry is added to the ticket timeline.	As expected.	Pass

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-011	Ticket due date reflects the configured SLA hours for its priority.	1. Log in as a super admin and set SLA hours for 'High' priority to 24. 2. Raise a new 'High' priority complaint. 3. Check the ticket's due date.	Due date equals ticket creation time plus 24 hours.	As expected.	Pass
TC-012	Customer submits feedback after their ticket is resolved.	1. Log in as a customer with a resolved ticket. 2. Open the ticket and click 'Give Feedback'. 3. Enter a rating, comment, and satisfaction level. 4. Submit.	Feedback is saved and linked to the resolved ticket; it is visible to the support team.	As expected.	Pass
TC-013	Customer searches the Knowledge Base for a relevant FAQ.	1. Log in as a customer. 2. Open Knowledge Base. 3. Search a keyword (e.g. 'refund').	Articles matching the keyword are returned, ranked by relevance; view count increases for opened articles.	As expected.	Pass
TC-014	Customer attempts to access the Audit Logs page directly via URL.	1. Log in as a customer. 2. Navigate directly to the Audit Logs URL/route.	Access is denied (role-based access control blocks the Customer role from Audit Logs).	As expected.	Pass
TC-015	Super admin views the Analytics Dashboard.	1. Log in as a super admin. 2. Open the Analytics Dashboard.	Dashboard shows accurate counts (total/active customers, complaints today, pending/resolved) and charts matching the underlying ticket data.	As expected.	Pass

Bug Tracking

Bug ID	Bug Description	Steps to Reproduce	Severity	Status	Additional Feedback
BG-001	Ticket due date is not recalculated after an admin changes the SLA hours for its priority level after the ticket was already created.	1. Raise a 'High' priority complaint (24h SLA). 2. As admin, change 'High' SLA to 12h. 3. Reopen the existing ticket.	Medium	Closed	Fixed by recalculating due date on SLA change for tickets still open; resolved tickets are left untouched by design.
BG-002	AI category suggestion is occasionally blank when the complaint description is very short (under ~5 words).	1. Raise a complaint with a 3-word description. 2. Check the auto-suggested category.	Low	Open	Consider requiring a minimum description length, or improving the fallback heuristic for very short text.
BG-003	A customer could view another customer's ticket details by directly editing the ticket ID in the URL.	1. Log in as Customer A. 2. Note the ticket URL for one of Customer A's tickets. 3. Edit the ticket ID in the URL to a ticket belonging to Customer B.	High	In Progress	Security issue — server must verify the requesting customer owns the ticket before returning ticket data, not just check the JWT is valid.

Bug ID	Bug Description	Steps to Reproduce	Severity	Status	Additional Feedback
BG-004	Knowledge Base search is case-sensitive, so 'Refund' and 'refund' return different result sets.	1. Search Knowledge Base for 'Refund'. 2. Search again for 'refund'. 3. Compare result counts.	Low	Closed	Fixed by normalizing search input and article keywords to lowercase before matching.
BG-005	Feedback sentiment is always shown as 'Neutral' for comments written in a language other than English.	1. Submit feedback with a non-English comment expressing clear dissatisfaction. 2. Check the derived sentiment on the feedback record.	Medium	Open	Gemini-based sentiment call may need explicit multilingual handling, or a language-detection step before sentiment analysis.

Sign-off

Tester Name: [Name of Tester]

Notes

- All test cases above cover both positive scenarios (valid input, expected happy path) and negative scenarios (invalid input, unauthorized access, missing data).
- Testers should provide detailed feedback, including suggestions for improvement, in the Additional Feedback column.
- Bug tracking includes severity, status, and steps to reproduce for every reported issue.
- Sign-off from both the project manager and product owner should be obtained before proceeding with deployment.
